Programming Languages:

Python (intermediate)	Java (intermediate)	C++
JavaScript (intermediate)	HTML/CSS (intermediate)	MatLAB

Summary of Skills:

Linux	Git/Github	DevSecOps	UML
Jira	Zoho	Troubleshooting	Fast Learner

Education

Bachelor of Science: Computer Science, Western Governors University

Graduation Date: 05/2025

Clearance:

Interim Secret Clearance

Work History:

L2 Tech Support, Dover Fueling Solutions

(10/2023 – Current)

- Developed automation to increase support efficiency by 200 percent. Worked with colleagues and customers to develop documentation, processes, systems, websites, and software to boost the productivity of our support team. Thus enabling our team to be cut in half (for budgetary reasons) while doubling the amount of support issues that can be handled.
- Managed incoming calls through the 3CX call system, utilizing TeamViewer to remotely access fuel technicians' laptops for troubleshooting wireless devices. Additionally, leveraged AWS cloud-connected services and RouterOS tools to remotely configure and diagnose device issues, documenting and tracking each case in Zoho for efficient issue resolution

IT Specialist, Cumberland University

(09/2022 – 12/2022)

- Assisted with network infrastructure setup including routers, switches & wireless access points
- Supported configuration needs including Configured IP addresses, VLANs, DNS, DHCP, and other essential network settings to ensure smooth connectivity for end users.
- Monitored security systems for potential threats - responding to alerts/incidents, in an effort to prevent breaches and maintain data integrity.
- Provided technical support to end-users, ensuring reliable and secure IT operations

Work Projects

- Onboarding Automation (in progress):** Working within PCI compliant environment to automate the process of onboarding our devices and troubleshooting, utilizing Java and Python.
- Key Generator:** Python program that allows fuel techs to easily generate new pairing keys, for AvaLAN wireless radios.
- Help Desk Automation:** Created an automated bot that walks customers through our troubleshooting process and creates tickets, eliminating the need for Tier 1 & 2 support.

Personal Projects

- Event Management (in progress):** Currently developing a app specialized in event management for the Ledges. Allowing them to manage golf tournaments and their events from one app. The backend is written in Java with Spring, while the frontend will be utilizing Sveltekit.
- Talent Partnership Program:** Developed a full stack web app in PHP with Laravel. The App focused on enabling job seekers to post their projects and rate other job seekers, then allowing recruiters to view the rated job seekers along with relevant information. The website can be found at <https://nonprofit.darrenv.com>
- File Transfer Python Project:** Building from the ground up a client/server program that allows a user to download any file in a given directory, along with an interface for the user to easily see and download the files.

Web: darrenv.com

- **Cloud Infrastructure:** Designed and managed on-premise cloud infrastructure with RAID backup, hosting family services such as VPN, cloud storage, and personal websites using a hypervisor.

Academic Projects

- **Java Backend:** Developed a high-performance, multithreaded backend for an e-commerce platform using the Spring framework. Implemented RESTful APIs to enable seamless communication with an Angular frontend.
- **Machine Learning Application:** Designed and implemented a machine learning model in Python using a multilinear regression model to accurately predict housing prices based on historical and demographic data.
